

PROOF-SETTLED ESCROW · ATTESTCOIN PROTOCOL

Pay on Ethereum. Release on proof.

A deal opens on Creditcoin with the gage locked. The counterparty pays on Ethereum. Attestcoin proves that exact payment to a Creditcoin contract, and the gage releases automatically. No bridge holds the money. No oracle operator can lie.

Cross-chain deals still run on trust in a stranger

\$2.2B

Every cross-chain deal today asks one question: who do you trust to tell the other chain that the payment happened?

Four steps, zero trusted parties

01

The gage locks

Maker posts terms on
Creditcoin: amount,
counterparty, expiry, reference.
The gage locks in the same
transaction.

02

The payment lands on Sepolia

The counterparty pays into the
escrow. One unambiguous
event carries the deal id.

03

Attestcoin proves it

Attestors witness the block.
Merkle and continuity proofs
verify through precompile
0x0FD2.

04

The gage releases

The contract decodes the
proved payment, matches the
terms, pays out. Same
transaction.

```
pay(sepolia) → attest(cc3) → prove(0x0FD2) → release(cc3)
```

The protocol is the mechanism, not a garnish

Synchronous precompile verification

The ASC calls the native query verifier precompile 0x0FD2 directly. Inclusion and continuity checked on-chain, in one Creditcoin block.

Proof of the exact transaction

Merkle inclusion plus block continuity pin the exact Sepolia payment. The contract matches amount and reference against the deal terms.

Batch settlement

Up to 10 payments proved and released in one Creditcoin transaction.

Permissionless settlement

No privileged relayer. Proofs are deduplicated on-chain. Anyone can submit.

BUILT ON

Attestcoin Smart Contracts

ASCBase · EvmV1Decoder

Official Gluwa base layer: verify, dedupe by query id, delegate to app logic.

WORKER · GITHUB ACTIONS CRON EVERY 5 MIN

Stateless, idempotent, replaceable. Settlement has no privileged relayer.

What is real, what is limited

REAL AND ON-CHAIN

16 deals opened, 13 settled by proof, 1 batch settle, 1 expiry refund, all verifiable on explorers.

Settlement is permissionless and deduplicated on-chain.

Console reads are direct RPC. No mocks.

LIMITED, DISCLOSED

Testnet value only.

Demo counterparties are operator wallets.

The worker is a GitHub Actions cron; anyone can run their own.

Payer reclaim is code-verified, not lapsed live.

Writability is upstream, in audit.

The full table lives in the repository readme, every settle tx linked.

THE 90 SECOND PATH

Open the console.
Open a deal.
Verify it yourself.
